

James Hutton Limited harnesses the scientific expertise and resources of the James Hutton Institute to provide research and consultancy services for organisations from a wide range of commercial sectors. This includes genetics, research and project services for cereals.

Arable Scotland is an opportunity for James Hutton Limited to showcase barley genetics projects led by James Hutton Institute colleagues, which will have a notable impact on commercial barley breeding and growing practices.

We would usually produce the Hutton Harvest in June, to coincide with exhibiting at the Cereals event and in the spirit of this, we've gathered information about some projects that would have been highlighted as part of our display to present to you virtually.

These are just a couple of examples of commercially relevant cereal projects taking place at the James Hutton Institute, home of the [International Barley Hub](#). For further information, the relevant contacts are given in the articles.
